

WOD 017

- reed canary grass / phragmites marsh
- 50+ snags ranging from 10-60 dbh
- limited woody component (live growth)
- likely seasonally flooded (has high flood retention)
- no alteration of hydrology expected.
- trail running along forest edge at S end of marsh
- stream runs in/out (direction unknown) of SE end. It is intermittent presently but likely sees higher water levels seasonally. Further SE (in forest) the creek forms a small pool of water (inflow comes from agricultural field).

WOD 018

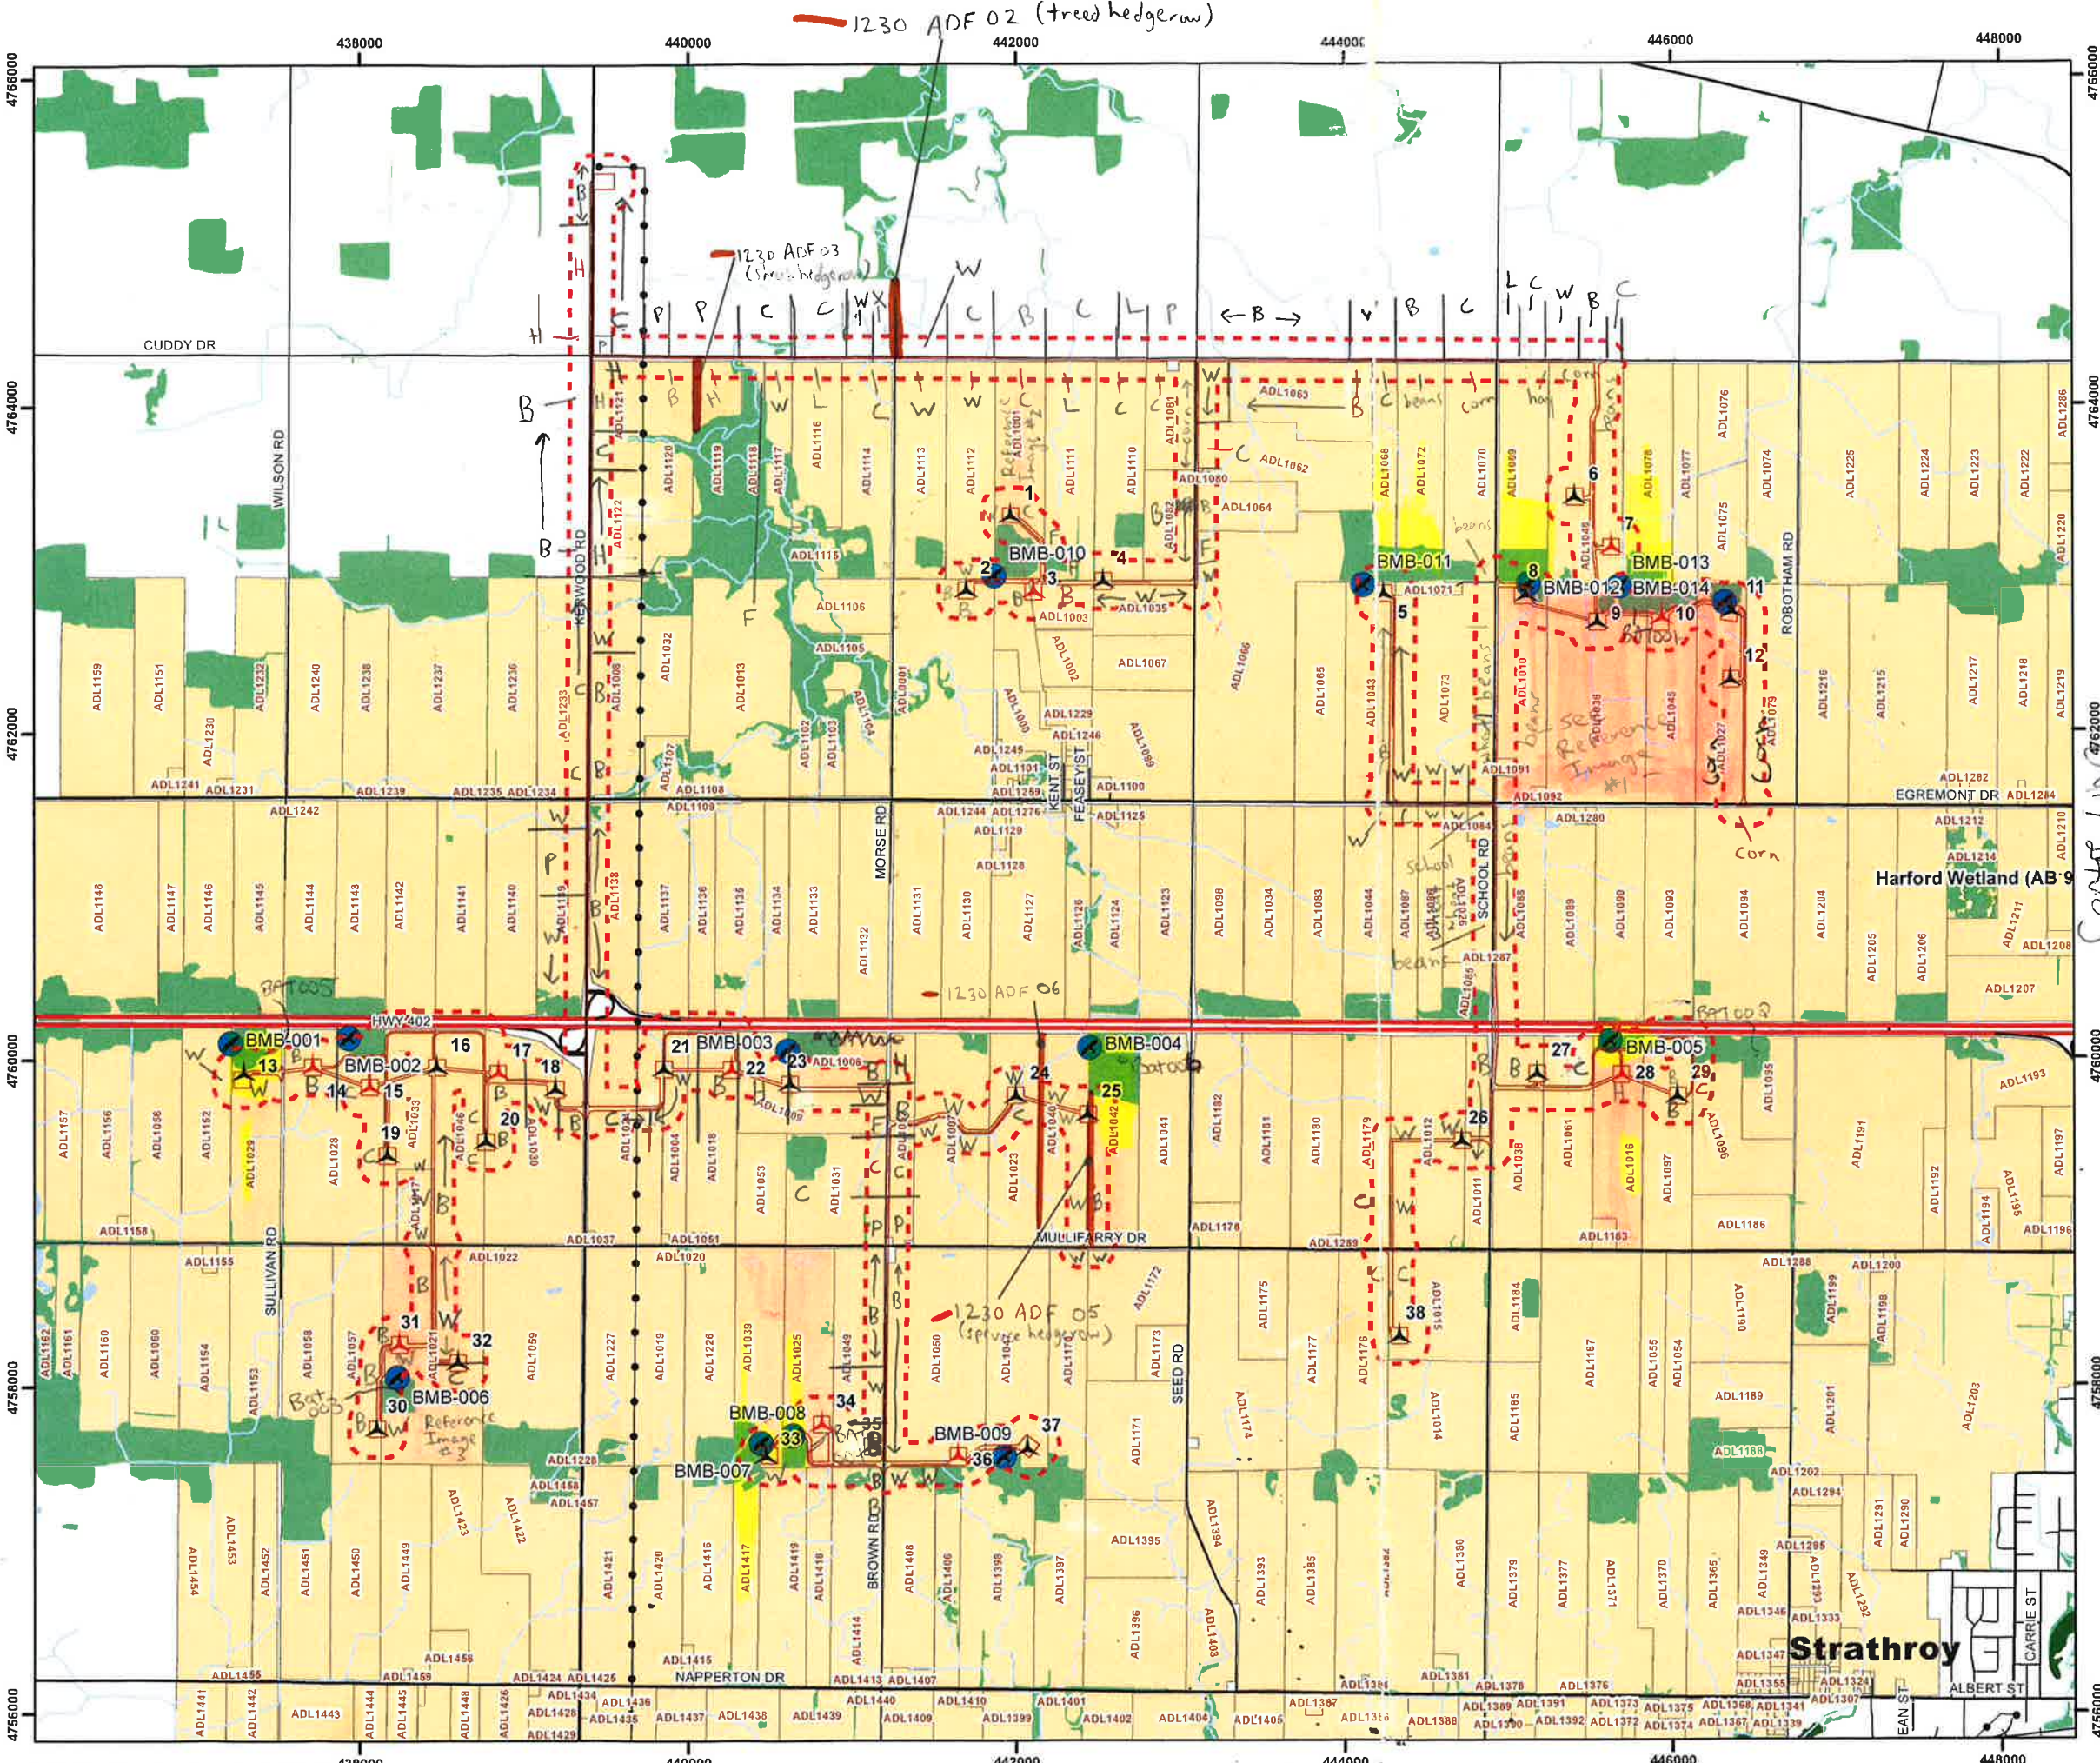

- not wetland (swamp)... more a fresh-moist deciduous forest.
- moonseed (not wild cucumber) through forest occasionally.
- areas of seasonal flooding
