EXECUTIVE SUMMARY

Bornish Wind, L.P., retained RWDI AIR Inc. to conduct an immission acoustic audit of the Bornish Wind Energy Centre located in Middlesex County, Ontario. The purpose of this audit is to capture long-term acoustic measurements of the sound level produced by the operation of the wind turbines for comparison with the applicable Ministry of the Environment and Climate Change (MOECC) sound level limits. This audit report is the first of two immission audit reports as required by the Renewable Energy Approval (REA) for the facility.

The facility is owned by Bornish Wind, L.P. The wind farm consists of a combination of forty-five (45) General Electric (GE) 1.6-100 (1.62 MW) wind turbine generators and one (1) transformer substation in the project switchyard. The project then connects to one of two step-up transformers at the Parkhill Interconnect. The total nameplate capacity of the wind farm is 72.9 MW.

Unattended measurements were conducted at three representative points of reception to assess sound immissions from the wind turbine farm in accordance with the REA conditions. Weather monitoring instrumentation was co-located with the sound level meters; including wind speed and directions. Precipitation data was collected at a single monitoring location.

The fall measurement program began on August 28, 2014 and ended on December 19, 2014. The fall program analyzed data from September 15th, 2014 until November 23rd, 2014. The time period between August 28th and September 14th, 2014 was omitted due to high insect noise at the monitoring locations. The data from November 24th to December 19th was not needed to attain the required minimum number of data intervals at all monitoring locations.

The facility is required to meet the sound level limits identified in the REA. The minimum number of measurement intervals was obtained for all wind bins at all monitoring locations for the turbine operational and turbine parked conditions. The results of the study indicate the facility is in compliance with the sound level limits identified in the REA.

1. INTRODUCTION

Bornish Wind, L.P., retained RWDI AIR Inc. (RWDI) to conduct an immission acoustic audit of the Bornish Wind Energy Centre (Bornish) located in Middlesex County, Ontario. The purpose of this audit is to capture acoustic measurements of the sound level at nearby receptors produced by the operation of the wind turbines for comparison with the applicable Ministry of the Environment and Climate Change (MOECC) sound level limits. This immission audit is intended to meet the requirements of Part D of the undated MOE Publication "Compliance Protocol for Wind Turbine Noise" PIBS# 85402 (Protocol).

The wind turbines and ancillary equipment are located on privately owned farmland through a legal agreement between the landowner and Bornish Wind GP, ULC, as general partner for and on behalf of Bornish Wind, L.P. The zoning within the project area and surrounding areas is mainly general agricultural with some extractive industrial. The acoustic environment surrounding the project area is rural and is influenced primarily by road traffic, farming activities, and the sounds of nature. Zoning information is included in Appendix A.

The facility's Renewable Energy Approval (REA), number 2494-94QQ97 dated April 26, 2013 and amendments in March and December 2014, are provided in Appendix B. Condition F of the REA requires the facility to complete two immission acoustic audits at three locations; one test in the fall (suggested October/November) and one in the spring (suggested March/April). This report presents the results of the fall immission audit test.

Unattended measurements were conducted at three representative points of reception to assess sound immissions from the wind turbine farm. The points of reception were selected based on historical weather data for the area and the modelling results provided in the "Bornish Wind Energy Centre Noise Impact Assessment Report", dated April 2013 and prepared by GL Garrad Hassan Canada (NIA).

A detailed discussion of the audit procedures and data analysis is provided in the subsequent sections.

2. FACILITY DESCRIPTION

The facility is owned by Bornish Wind GP, ULC, as general partner for and on behalf of Bornish Wind, L.P. The Bornish wind farm became commercially operational in August 2014.

The project site is located in Middlesex County, Ontario. It is generally bounded by Elm Tree Drive to the south, Sylvan Road to the west, Nairn Road to the north and Fort Rose Road to the east.

The Bornish wind farm consists of forty-five (45) General Electric 1.6-100 wind turbine generators and one (1) transformer substation in the project switchyard. The project connects to one of two 225 MVA step-up transformers at the Parkhill Interconnect. The total nameplate capacity of the wind farm is 72.9 MW. All turbines have a hub height of 80 m above local grade.

3. INSTRUMENTATION

All instrumentation used for the immission testing followed the requirements set out in the MOECC Protocol.

3.1 Acoustic Instrumentation

The measurements were conducted using two Brüel & Kjær 2250 Type 1 and one Brüel & Kjær 2270 Type 1 precision integrating sound level meters. A list of the acoustic equipment including serial numbers is provided in Appendix C. The 2250 and 2270 sound level meters are capable of recording both sound level and audio. Each sound monitoring site meets the following requirements:

- Type 1 sound level meter according to the IEC standard 61672-1 Sound Level Meter, Part 1: Specifications;
- Class 1 or Class 2 microphone systems;
- The instrumentation having constant frequency response over at the 20 Hz to 20000Hz frequency range;
- The filters meeting the requirements of IEC 61620 for Class 1 filters; and
- The instrumentation being capable of measuring audio recordings continuously during the measurement campaign, at sampling rate of at least 8000 Hz.

All sound monitoring locations were calibrated both before and after the measurement campaign using a Larson-Davis CAL250 precision acoustic calibrator. The calibrator's accuracy is equal to or better than +/- 0.3 dB and is Class 1 according to IEC 60942 within the temperature range of this measurement program.

In addition to the 90mm diameter primary wind screen that is commonly used for environmental noise monitoring, a secondary 500mm diameter wind screen was deployed at each location that meets the specifications indicated in IEC 61400-11.

3.2 Non-Acoustic Instrumentation

Each sound level monitoring location was co-located with a meteorological station. The weather station consisted of a Campbell Scientific weather console using a CR200 data logging system and a R.M. Young 05103-10 wind anemometer. Auxiliary measurement instrumentation for temperature, relative humidity, and precipitation was also recorded for the local area. The weather monitoring meets the requirements as required in the Protocol.

3.3 Calibration

All relevant acoustic equipment has calibration records that are traceable to an accredited acoustic laboratory and were within the valid calibration recertification time. All other equipment was within calibration range and recertification time.

4. MEASUREMENT PROCEDURE

4.1 Noise Measurement Location

The microphones were located at a height of approximately 4.5 metres above local ground representing a 2-storey residence. This height is consistent with dwellings located at the points of reception in this study and the modelled receptor heights identified in the NIA Report.

The microphones were located as close to the dwelling as practically and technically feasible, or in an acoustically equivalent location in accordance with the Protocol, as appropriate. More specifically, the microphones were located more than 5 m away from any large reflecting surface and away from trees or foliage that could affect the measurements. The monitoring positions were also positioned such that any intervening obstacles or terrain did not shield them from line of sight to the wind turbines.

4.2 Wind Measurement Location

The Protocol requires the wind measurement location be in close proximity to the sound measurement location. An anemometer was mounted to the same tower as the microphone at each of the sound measurement locations. A sensor for measuring temperature and relative humidity was located in the near vicinity to the wind farm. The weather measurement location was not shielded by nearby buildings or obstructions. Wind speed and direction measurements were obtained at a height of 10 m. All monitoring locations were configured to record data on one-minute intervals.

4.3 Acoustic Measurements

Turbines Operational

All monitoring locations were configured to log one-minute statistical sound level data. The key statistical data used in the analysis is the A-weighted one-minute energy equivalent sound level (L_{EQ} , 1 min in dBA). Audio recordings were also logged on a continual basis for sound identification purposes. Small interruptions in the data set occurred during daytime hours while checks and maintenance were conducted by RWDI personnel. Sound and weather measurement equipment were time synchronized with each other at each measurement location.

Appendix D includes a statement signed by an authorized representative of the Bornish wind farm confirming that all wind turbines were operating normally for the duration of the measurement time periods.

Turbines Parked

Meter configurations were not changed between the turbine operational and turbine parked conditions. The turbines were parked on several different occasions to establish ambient sound levels. During the parked conditions, all nearby influential turbines were stopped so that the measured sound levels at the point of reception were representative of ambient background levels. Acoustic measurements during parked conditions were obtained on the following dates during the normal audit time period between the hours of 22:00 and 05:00:

- September 29 to October 12,
- November 18/19, and
- November 19/20.

An initial shutdown for the entire wind farm occurred between September 29 and October 12, 2014. Data was collected for the parked conditions during this period as noted above.

4.4 Non-Acoustic Measurements

All meteorological stations were configured to continuously log the appropriate statistical parameters and outputted one-minute averaged data or instantaneous data where applicable. The station was configured to log the following data on one-minute intervals:

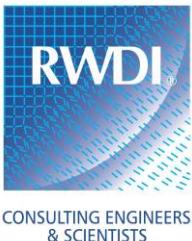

- average wind speed (m/s);
- maximum wind speed (m/s);
- minimum wind speed (m/s); and
- average wind direction (azimuth degrees).

Average temperature (degrees Celsius), average relative humidity (percentage) and precipitation data were collected at monitoring station C and is considered representative of all monitoring stations.

4.5 Number of Measurement Intervals

Turbines Operational

The Protocol requires that 120 one-minute intervals are required to be measured for each integer wind speed for the data set to be considered large enough to conduct the analysis and to be able to assess compliance. Wind speed measurements are rounded to the nearest integer prior to sorting to a representative integer wind speed "bin".

Turbines Parked

Ambient sound measurements were completed with all applicable turbines parked. The Protocol states that 60 one-minute intervals are required to be measured for each integer wind speed for the data set to be considered large enough to determine the ambient sound level. Wind speed measurements are rounded to the nearest integer prior to “binning”.

5. ACOUSTIC AUDIT PROCEDURE

5.1 Points of Reception

Condition F1 (2) of the REA requires measurements to be made at three different points of reception that represent the location of the greatest predicted sound levels and that are located in the direction of the prevailing winds. Additionally, the Protocol states that the points of reception should represent worst-case non-participating receptors.

Selected points of reception were identified based on those expected to be most affected by sounds from the operation of the wind farm. The most affected points of reception were determined from the noise contours provided in the NIA report. The numeric values used below for the receptor locations, are consistent with the NIA report. These points of reception were further refined to downwind locations that would receive a reasonable frequency of prevailing winds for the current season (i.e., westerly winds). This review resulted in points of reception being ideally positioned in the locations shown in Figure 1.

Ideally monitors should be located at the most impacted non-participating receptors. However for various reasons described below, this was not always feasible and alternate locations were selected that are acoustically equivalent and conservative. Based on informal conversations with MOECC, we understand that this approach should be acceptable.

Location A - monitor is positioned on the lands of a vacant lot receptor which is one of the top 5 highest impacted non-participating lands and the owner of the land was agreeable to cooperate with the audit. This monitor is also representative of vacant lot receptors VLR241 and VLR211 which are also within the top 20 points of reception. This location is considered advantageous given its ability to potentially capture multiple wind directions, greatly improving the odds of data collection. A temporary construction yard was located across the road from the monitoring location for part of the monitoring period.

Location B - monitor is positioned on the lands of a participating receptor directly across the road from non-participating vacant land receptors, VLR221 and VLR232. Access was preferred at this location due to overhead transmission lines. The monitor location is considered acoustically equivalent to being in the yards of these non-participating receptors, yet accommodates less interference with landowner uses due to farming activity. It is expected to experience similar or more conservative sound levels (i.e., closer to 40 dBA contour).

Location C - monitor is positioned on the lands of a participating receptor (PV264) directly across the road from two non-participating lands (a vacant lot VLR209 and residence PoR63). The owner of lot PoR63 declined to give permission to locate instrumentation on their property. The monitor location is acoustically equivalent to the two non-participating receptors as it is located southeast of the lots and conservative since it is closer to the predicted 40 dBA contour line.

5.2 Time of Measurements

The REA requires immission acoustic audit measurements be completed on two separate occasions within a period of twelve months during the lowest annual ambient sound levels. The stated preferred times in the REA are:

1. October and November; and
2. March and April.

This report is the first of two immission audit reports. Sound level measurements started on August 28, 2014. The fall program analyzed data from September 15, 2014 until November 23, 2014. The time period between August 28 and September 14, 2014 was omitted due to high insect noise at the monitoring locations. Although some monitoring continued after November 23, no additional useful data was obtained. The required minimum number of data intervals was obtained at all monitoring locations.

6. DATA PROCESSING

6.1 Data Reduction and Filtering

The measurement data must be filtered in accordance with the Protocol. Filters including wind direction and individual events were applied to the measurement data as required by the REA and suggested in the Protocol, respectively. The following filters were applied to the measured data and only the data that satisfied all four conditions were used in the subsequent analysis:

1. Measurements between 22:00 and 05:00;
2. No rainfall within the hour of the measurement interval;
3. The maximum and minimum wind speed during the interval did not differ from the average by more than 2 m/s; and
4. Removal of notable extraneous high level events (e.g., wind over microphone, traffic pass-bys, human activities, mechanical equipment including a local air conditioner, etc.).

Conditions during the measurement period are presented in Appendix E.

6.2 Effects of Insects and Fauna

The audio recordings were reviewed for sounds from insects and fauna. Sounds of crickets were audible and dominate at the beginning of the sampling program (August 28 – September 14) and this data was subsequently omitted from the study data for all Bornish monitoring locations. During the remainder of the measurement program, sounds of crickets were audible in both the operation and parked data; however the cricket noise was not dominant and thus was not omitted from the study data.

6.3 Data Analysis

Following the guidance of the Protocol, the “binning method” is used to analyze one-minute sound level data. All sound level data that correlates to wind speeds between 4 to 7 m/s need to be grouped into integer wind speed bins. Data within each bin is +/- 0.5 m/s of the specified integer wind speed. Data within these bins are subsequently filtered and used for further analysis as detailed in Section 6.4.

6.4 Determination of Turbine Sound Level

As described in the Protocol, the measured data obtained for both the total sound (turbines operational) and ambient sound (turbines parked) are first reduced and filtered as described in Section 6.1. The binned data are then averaged. The resulting sound levels generated by the turbines only are the logarithmic subtraction of the average measured total sound minus the average measured ambient sound at each wind speed bin. The resulting valid data is plotted in Figures 2 through 4 for all points of reception. Each graph is a plot of valid sound level data versus wind speed measured at the co-located weather station. Each plot shows the measured total sound, the measured ambient sound, and the resulting turbine-only sound levels. Wind rose plots for each point of reception are presented in Figures 5 through 7. Valid data for each point of reception can be found in Tables 1 through 3 for measured total sound and Tables 4 through 6 for measured ambient sound. A summary of the applicable sound levels based on the valid data is provided in Tables 7 through 9.

6.5 Tonal Assessment

An assessment of tonality should be completed as per the Protocol, if it is found to be present. Based on onsite observations made during visits to the site and review of several representative audio recordings, no tones were detected at each point of reception. In addition, tonality and tonal audibility data were provided by GE Energy. The data presented showed that the turbines have a tonal audibility which is below the value of positive three used for the criteria as per Part D, Section D3.8.3 of the Protocol. As a result, the turbines are not anticipated to have a tonal component associated with their operations.

7. ASSESSMENT OF COMPLIANCE

The facility is required to meet the sound level limits identified in the REA. For an immission audit scenario, the Protocol requires a minimum of 120 operational and 60 ambient one-minute intervals between 4 to 7 m/s integer wind speeds inclusively. The applicable sound level limits and resultant turbine-only sound levels at each point of reception are summarized Tables 7 through 9.

A facility is deemed to be in compliance if the resulting turbine sound levels do not exceed the sound level limit at each integer wind speed. The minimum number of measurement intervals was achieved for all wind bins at all monitoring locations. The required data intervals were achieved at all monitoring locations. The facility is in compliance with the sound level limits identified in the REA.

The Company shall use a discharge diffuser or other energy dissipation device, if necessary, to mitigate flows which physically alter the stream channel or banks; and,
 - (2) siltation control measures shall be installed at both the taking location upstream of the construction site and (if necessary) the discharge site and shall be sufficient for the volumes pumped. The Company shall take all measures to properly maintain these control devices throughout the construction period.
- I3. For water takings (by tanker) for the purposes of dust suppression, equipment washing, and similar activities:
- (1) notwithstanding the authorized rate of water taking, this Approval limits the taking of water at any site at the project location for up to 10% of the instantaneous streamflow present on the day or days of taking.
