## 1. Introduction

NextEra Energy Canada, ULC (NextEra) is proposing to construct a wind energy centre project in the Municipalities of Bluewater and South Huron, Ontario. The project will be referred to as the Goshen Wind Energy Centre (the “Project”).

This report has been prepared in accordance with the Ontario Ministry of the Environment (MOE) guideline “Noise Guidelines for Wind Farms – Interpretation for Applying MOE NPC Publications to Wind Power Generation Facilities” (October 2008). This report will form part of the Renewable Energy Approval (REA) application for the Project as required under Ontario Regulation 359/09.

## 2. Project layout

Approval is being sought for 66 wind turbine locations, 65 of which are rated at 1.6 Megawatts maximum generation capacity and one rated at 1.56 Megawatts maximum generation capacity. However, only 63 of the wind turbines will ultimately be constructed in order to achieve the Project nameplate generation target of up to 102 Megawatts. All of the wind turbines will feed into a centrally located transformer substation.

The proposed Project is located in Huron County, within the Municipalities of Bluewater and South Huron. The Project Study Area consists of the areas being studied for the wind farm components (Wind Energy Centre Study Area), as well as for the interconnection route (i.e., the area being studied for transmission lines to connect the Project to the electrical grid) (Transmission Line Study Area). The Wind Energy Centre Study Area is generally bounded by Klondyke Road to the west, Rogerville Road to the north, Parr Line to the east, and Mount Carmel Drive to the south, in the Municipalities of Bluewater and South Huron. The Transmission Line Study Area is located to the east of the Wind Energy Centre Study Area, and is generally bounded by Parr Line to the west, Thames Road to the north, Perth 164 Road to the east, and Park Road to the south, extending into the Municipality of South Huron.

The location of the Project Study Area was defined early in the planning process for the proposed wind energy facility, based on the availability of wind resources, approximate area required for the proposed project, and availability of existing infrastructure for connection to the electrical grid. The Project Study Area was used to facilitate information collection.

A figure showing the project location, wind turbine layout and transformer location is provided in Appendix A.

### 3. Noise assessment guideline

Part V.0.1 of the Ontario Environmental Protection Act R.S.O. 1990 (EPA) addresses the approvals process required for renewable energy projects and Ontario Regulation 359/09 outlines the specific requirements for obtaining a Renewable Energy Approval (REA) from the MOE.

As required by O.Reg. 359/09, noise from wind farm projects requiring approval within Ontario are assessed using the MOE guideline: “Noise Guidelines for Wind Farms – Interpretation for Applying MOE NPC Publications to Wind Power Generation Facilities” (PIBS 4709e, October 2008). This guideline sets the definitions, assessment procedures and noise level limits for noise assessments of wind farm projects.

The project area is best defined as Class 3 rural, as per MOE Publication 4709e. A Class 3 Area is defined as “a rural area with an acoustical environment that is dominated by natural sounds having little or no road traffic, such as the following: a small community with less than 1000 population; agricultural area; a rural recreational area such as a cottage or a resort area; or a wilderness area.” The MOE noise level limits, at integer wind speeds, for points of reception are summarized in Table 1 below.

**Table 1. Noise Level Limits for Wind Turbines**

Point of Reception Classifications	1-hr L <sub>eq</sub> Sound Level Limit (dB(A)) at 10m height Wind Speeds (m/s)				
	Less than or equal to 6 m/s	7 m/s	8 m/s	9 m/s	Greater than or equal to 10 m/s
<b>Class 1 &amp; 2 Areas</b>	45.0	45.0	45.0	49.0	51.0
<b>Class 3 Areas</b>	40.0	43.0	45.0	49.0	51.0

## 4. Noise sources

Table 6 and Table 7 of Section 9 provide the coordinates of all noise sources considered in the noise impact analysis and assessment.

### 4.1 Wind turbine noise sources

There are two wind turbine models proposed for this project. These are the following:

- 65 General Electric model GE 1.6-100 turbines with Low-Noise Trailing Edges (LNTE).
  - Hub height of 80 metres
  - Rotor diameter of 100 metres
  - Maximum generation capacity of 1.6 Megawatts
- One General Electric model GE 1.56-100 turbine.
  - Hub height of 80 metres
  - Rotor diameter of 100 metres
  - Maximum generation capacity of 1.56 Megawatts

Manufacturers' noise data for the wind turbine models are summarized in Table 4 of Section 9 and the original manufacturer's datasheets are provided in Appendix B. The noise datasheets provided have been prepared and reported in accordance with IEC 61400-11 (equivalent to CAN/CSA-C61400-11). The calculations used to adjust for site specific wind shear are also presented in Appendix B.

The MOE requires that the cumulative noise impact of existing or proposed<sup>1</sup> wind farms also be included in the noise impact analysis. To that end all existing or proposed wind turbines within 5 kilometres of the Project were included in the noise impact analysis. There are two facilities which meet this description. They are:

- The Zurich Wind Farm
  - Existing wind turbine installation
  - Consists of one Enercon E-48 model turbine with a rated generation capacity of 800 kilowatts.
- Grand Bend Wind Farm
  - Proposed wind turbine installations
  - Consists of forty eight Siemens SWT-3.0-113 model turbines with a rated generation capacity of 2483 kilowatts per unit.

All forty eight proposed locations from the Grand Bend Wind Farm Environmental Noise Impact Assessment, dated February 05 2014, have been included in this noise assessment.

Manufacturer's noise data for all assessed wind turbines (those proposed Goshen Wind Energy Centre, and other existing / planned facilities) are summarized in Table 4 of Section 9 and the original manufacturers' datasheets is provided in Appendix B. The noise datasheets have been prepared and reported in accordance with IEC 61400-11 (equivalent to CAN/CSA-C61400-11). The calculations used to adjust for site specific wind shear are also presented in Appendix B.

---

<sup>1</sup> Based on MOE guidelines, proposed projects which have not yet published a site plan have not been accounted for in the noise impact analysis.

## 4.2 Wind turbine transformer noise sources

The electricity generated by the Goshen Wind Energy Centre will be collected at a central transformer substation. The performance specification of the transformer will require that the noise emissions be measured in accordance with ANSI/IEEE C57.12.90 at the highest (MVA) rating with all fans in operation and at the tap position that creates the highest current. The proposed transformer for the Project is a 69/92/115 MVA Prolec GE transformer.

The performance specification will require that the average sound pressure level measured in accordance with ANSI/IEEE C57.12.90 shall not exceed 75 dB(A) over the measurement surface (as defined in the ANSI/IEEE standard).

In the event of a transformer failure, a spare transformer will be installed at the same location as this transformer. This transformer will be a 102/136/170 MVA Prolec GE transformer. The performance specification for the spare transformer will require that the average sound pressure level measured in accordance with ANSI/IEEE C57.12.90 shall not exceed 75 dB(A) over the measurement surface (as defined in the ANSI/IEEE standard).

As the spare transformer will be larger than the transformer used in normal operations, this transformer will have higher noise emissions. Therefore, the spare transformer has been used as the basis for this impact assessment.

An estimate of the noise emissions expected from the transformer is provided in Table 5. Appendix B includes a detailed calculation to support the transformer emission estimate. Note that a 5dB penalty has been added to the transformer emission level in the noise prediction modelling as per the requirements of PIBS 4709e.

The transformer will be installed on a concrete pad and surrounded by gravel. In order to include the effect of reduced absorption in the source zone (as defined by ISO 9613-2), the following reductions in ground absorption have been made for this source (compared to the levels given in *Noise Guidelines for Wind Farms – Interpretation for Applying MOE NPC Publications to Wind Power Generation Facilities*):

- Source zone ground absorption  $G_s$ , reduced from 1.0 to 0.0
- Receiver zone ground absorption  $G_r$ , unchanged at 0.5
- Middle zone ground absorption,  $G_m$ , unchanged at 0.8

These changes have been implemented for the closest non-participating receptor to the transformer. The transformer will have a 2.5 metre high noise barrier on the east, south and west sides of the Project transformer substation. The noise barrier should have an absorptive surface on the side facing the transformer with a minimum Noise Reduction Coefficient (NRC) of 0.8. The noise barrier should have a minimum surface density of 20 kg/m<sup>2</sup> or a minimum Sound Transmission Class (STC) of STC32 and should not have any gaps or cracks. The co-ordinates of the transformer, as well as end-points and corners of the noise barrier are provided in Table 2.

Additionally, a transformer is planned as part of the Grand Bend Wind Farm. Co-ordinates for this transformer are provided in Table 2.

**Table 2. Transformer and associated noise barrier locations**

Identifier	Project	Equipment Make & Model	UTM Coordinates (NAD83 Zone 17N)		Remarks
			Easting	Northing	
G_Trans	Goshen	Prolec GE 102/136/170 MVA	454556	4794883	—
Noise Barrier	Goshen	—	454560	4794883	East endpoint
Noise Barrier	Goshen	—	454560	4794878	South/east intersection
Noise Barrier	Goshen	—	454550	4794878	South/west intersection
Noise Barrier	Goshen	—	454550	4794883	West endpoint
GB_Trans	Grand Bend Wind Farm	Prolec GE 125 MVA	446771	4804804	5.1 metres source height
GB_Reactor	Grand Bend Wind Farm	—	446781	4804827	11.0 metres source height

## 5. Points of Reception

The Noise Impact Summary Table, provided in Section 9, lists all of the points of reception within 2000 metres of the Project turbines and the associated coordinates as per Section 6.1 d) of the MOE noise guideline (PIBS 4709e). The points of reception have been classified into four different categories which are outlined in Table 3, below.

**Table 3. Point of Reception Classifications**

Class	Description	Quantity		Remarks
		Within 2km	Within 1500 metres	
NP	Non-participating	925	706	MOE Limits Apply
PR	Participating	55	55	MOE Limits Do Not Apply
VNP	Vacant Lot Non-participating	314	236	MOE Limits Apply
VPR	Vacant Lot Participating	54	51	MOE Limits Do Not Apply

The classifications NP and VNP are both non-participating and are subject to the noise level limits outlined in the MOE noise guideline (PIBS 4709e, see Table 1).

The classifications PR and VPR are both participating and are not subject to the noise level limits outlined in the MOE noise guideline. Participating points of reception are associated with the wind farm development via a legal agreement with the owner of the subject property, to allow the installation and operation of wind turbines or related equipment.

## 6. Detailed Noise Impact Assessment

The noise impact analysis for the Project was completed using the Cadna/A environmental noise modelling software. The noise modelling was conducted in accordance with the international standard ISO 9613-2. The noise predictions were calculated using downwind propagation from each source to each point of reception. This method produces a theoretical worst case prediction at each point of reception. The noise impact calculations were completed using octave band spectral values in the range of 63 to 8000Hz for each integer 10 metre height wind speed from 6 to 10m/s.

The noise model was configured to calculate the resultant noise impact at each point of reception within 1500 metres of the Project turbines as per Sections 6.3 and 6.4.1 of the MOE noise guideline (PIBS 4709e). The contribution of each noise source located within 5000 metres from each point of reception was included in the noise impact calculation according to Section 6.4.9 of PIBS 4709e. The air attenuation and ground attenuation calculation within the model were configured according to Section 6.4.10 of PIBS 4709e.

The noise impact at each point of reception, for each integer 10 metre height wind speed from 6 to 10m/s, is presented in the Noise Impact Table (Section 9). All of the noise predictions were completed in accordance with the detailed requirements of the MOE noise guideline (PIBS 4709e).

### 6.1 Ground Absorption

An investigation by Evans and Cooper (2012)<sup>2</sup> on differences between predicted and measured wind turbine noise levels showed that for concave shaped terrain, using hard ground under ISO 9613-2 provides a more accurate prediction methodology than with ground absorption. In order to determine whether any receptors could be deemed to be on concave ground, the criterion presented in the UK Institute of Acoustics document *A Good Practice Guide to the Application of ETSU-R-97 for the Assessment and Rating of Wind Turbine Noise* was used.

Under the approach taken in this document, ground is defined as concave if a turbine-receptor pair fulfils the following criterion:

$$h_m \geq 1.5 \times \left( \frac{\text{abs}(h_s - h_r)}{2} \right)$$

Where  $h_m$  is the mean height above ground for noise transmission as defined in ISO 9613-2, and  $h_s$  and  $h_r$  are the local heights of the source and receiver above ground.

Analysis was conducted on all turbine-receptor pairs, and it was determined that no turbine-receptor pairs satisfy this criterion for the Goshen Wind Energy Project.

### 6.2 Terrain screening

Wind turbines have been modelled as a single point source at hub height, consistent with standard modelling practice for wind turbines. However, as aerodynamic noise is generated from the blade surfaces, it is noted that noise will be produced over the swept area of the turbine. This means that terrain screening, or a ground barrier effect, would be reduced unless the entire swept area of the turbine blades is screened from a noise receptor. In order to account for this reduction in screening, modifications were made to the calculation algorithm for the calculation of wind turbine noise levels.

<sup>2</sup> Comparison of Predicted and Measured Wind Farm Noise Levels and Implications for Assessments of New Wind Farms, Acoustics Australia 40(1), 28-36 (2012)

The screening attenuation ( $A_{bar}$ ) is calculated under ISO 9613-2 using the following equation (equation 14 from the ISO standard):

$$A_{bar} = D_z - A_{gr} > 0$$

$$D_z = 10\log \left[ C_1 + \frac{C_2}{\lambda} C_3 z K_{met} \right]$$

The values  $C_1$ ,  $C_2$  and  $C_3$  are calculation parameters that vary based on the conditions being assessed. The remaining values represent wavelength ( $\lambda$ ), mean path difference ( $z$ ) and a meteorological correction ( $K_{met}$ )

For single diffraction, where ground reflections are not taken into account separately, values of  $C_1 = 3$ ,  $C_2 = 20$  and  $C_3 = 1$  are used. In order to set ground screening to zero, values of  $C_1 = 1$ ,  $C_2 = 0$  and  $C_3 = 0$  were used in the calculation algorithm for all calculated wind turbine noise levels.

As screening still applies to noise levels from the transformer, a separate calculation was carried out, using the default ISO 9613-2 values of  $C_1 = 3$ ,  $C_2 = 20$  and  $C_3 = 1$  to calculate transformer noise levels. The transformer and turbine noise levels were then summed logarithmically at all receptors to obtain overall noise levels.

## 7. Results and compliance

The results of the noise modelling in The Noise Impact Table (Appendix A) show that the Project is predicted to operate in compliance with the MOE noise level limits at all points of reception within 1500 metres of the Project turbines. Appendix C includes noise contour maps for each integer 10 metre height wind speed from 6 to 10m/s and a sample calculation is provided in Appendix D.

Provided the noise mitigation described in Section 4.2 above is implemented, the Project is predicted to comply with the MOE sound level limits for Wind Turbines in Class 3 areas for all of the non-participating (NP) and vacant lot non-participating (VNP) points of reception assessed.

## 9. Summary tables

**Table 4. Wind Turbine Acoustic Emission Summary Tables**

Tables are provided with A-weighted octave band sound power levels in order to be consistent with manufacturer supplied data. Manufacturer supplied data provides all octave band sound power levels in A-weighted levels. The below tables are replicated in Appendix E as linear (unweighted) octave band levels. Please note that the levels shown in Appendix E are equivalent to the levels presented in the following tables.

Notes:										
1. The parcel on which this receptor is located (from the Grand Bend Wind Farm Noise Assessment) is an industrial facility. This receptor has not been incorporated into the Goshen Noise Assessment Report										
2. The parcel on which this receptor is located (from the Grand Bend Draft Site Plan) is a landlocked parcel, on which a residence could not be constructed. Therefore this receptor has not been incorporated into the Goshen Noise Assessment Report.										
3. The Grand Bend Wind Farm Noise Impact Summary Table includes contributions from the Goshen Wind Energy Centre. Therefore, this value represents the noise level calculated as part of this assessment for only the Grand Bend Wind Farm turbines.										

**Noise Impact Assessment Table**Notes to Table:

1. As per section 6.1 a), of PIBS 4709e, points of reception up to 2000 metres are identified in the table and the project site plan. However, as per sections 6.3 and 6.4.1 noise levels have only been predicted for points of reception within 1500 metres of a Project wind turbine. Therefore the noise level results for points of reception at distances of greater than 1500 metres from the nearest Project wind turbine appear as dashes (-). The associated limits and compliance columns also appear as dashes (-) for these entries as compliance assessment is not required by the guideline.
2. Participating receptors are not subject to the MOE noise limits and in these cases the noise limit entries are represented as dashes (-), in such cases the associated compliance column also appears as a dash (-) since a compliance assessment is not required.

Table Abbreviations:

NP	-	Non-participating Point of Reception
VNP	-	Non-participating Vacant Lot Point of Reception
PR	-	Participating Point of Reception
VPR	-	Participating Vacant Lot Point of Reception
C	-	Compliant with MOE sound level limits for Wind Turbines in Class 3 areas (See Table 1)
NC	-	Not Compliant with MOE sound level limits for Wind Turbines in Class 3 areas (See Table 1)

Point of Reception ID	Description	Height	UTM Coordinates		Distance to Nearest Project Turbine (m)	Nearest Project Turbine ID	Distance to Project Transformer Substation (m)	Calculated Sound Level at Selected Wind Speeds (dBA)					Sound Level Limit (dBA)					Compliance Test
